

Sprint Board

Burndown Chart

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes, the story point estimations reasonably reflected the relative effort and complexity of each task. Simpler tasks such as logging consumption were given fewer story points, while more complex tasks such as calculating emissions, tracking reduction milestones, and implementing security were assigned higher points. This helped me organize and prioritize the workload during the sprint.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized logically. The core functionalities, such as recording electricity, transport, and gas consumption and calculating carbon emissions, were handled

first. Features related to historical comparisons and reduction milestones were added afterwards, followed by important non-functional requirements such as graph performance and data security.

3. How did your simulated sprint align with your plan?

The simulated sprint mostly followed the planned workflow. User stories were organized under their respective epics, assigned story points, and moved through different stages including To Do, In Progress, In Review, and Done. Additional stories were also added later as more requirements were incorporated, making the sprint progression more realistic.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how my workload changed throughout the sprint. The remaining story points decreased as tasks were completed, but increased at certain points when additional user stories were added. This showed that adding more work during a sprint can affect the expected progress and highlights the importance of planning work according to individual capacity.
